PATIENT RELATIONSHIP TO INSURED SELF SPOUSE CHILD OTHER

Important! Read this notice before using your new eyewear! Please ask us if you do not understand any of the following. We are happy to provide you a copy of this warning if you would like to keep one.

Proper selection and use of eyewear is critical to your eye safety. No single pair of eyeglasses is best for all situations, so make sure you consider how your eyeglasses will be used before deciding whether to wear dress, safety or sports eyewear.

*Your new eyeglasses are dress eyewear, not safety spectacles.

*The type and style of the spectacle frame is an important, factor in determining how much protection your eyeglasses will provide. Many frames are fragile and are designed for appearance - not for protection.

*Your lenses are not unbreakable or shatterproof. Of all the materials that lenses can be made from polycarbonate is the most impact resistant. For tasks requiring additional impact protection, polycarbonate lenses should be used.

*If struck with sufficient force, the lens can break into sharp pieces that can cause serious injury to the eye, or blindness. Even if the lenses do not break, the force of impact may cause the lenses or spectacle frame to contact the eye or surrounding area, causing injury.

*The continued impact resistance of your lenses depends on how well you protect them from physical shocks and abuse. For your own protection, scratched or pitted lenses should be replaced immediately.

*If your occupational or recreational activities expose you to the risk of flying objects or physical impacts, your eye safety requires special safety spectacles with safety lenses, side shields, goggles and/or a full face shield.

*Your vision specialist can provide more information and help you select the proper eyewear to meet these vision safety needs.

*Many sports present unique eye safety risks. Neither dress eyewear nor industrial safety eyewear are designed to protect against these special risks. As a result, special eyewear designs have been developed for a number of sports. The standards for such eyewear vary according to the sport for which they are designed, so how the eyewear will be used.
